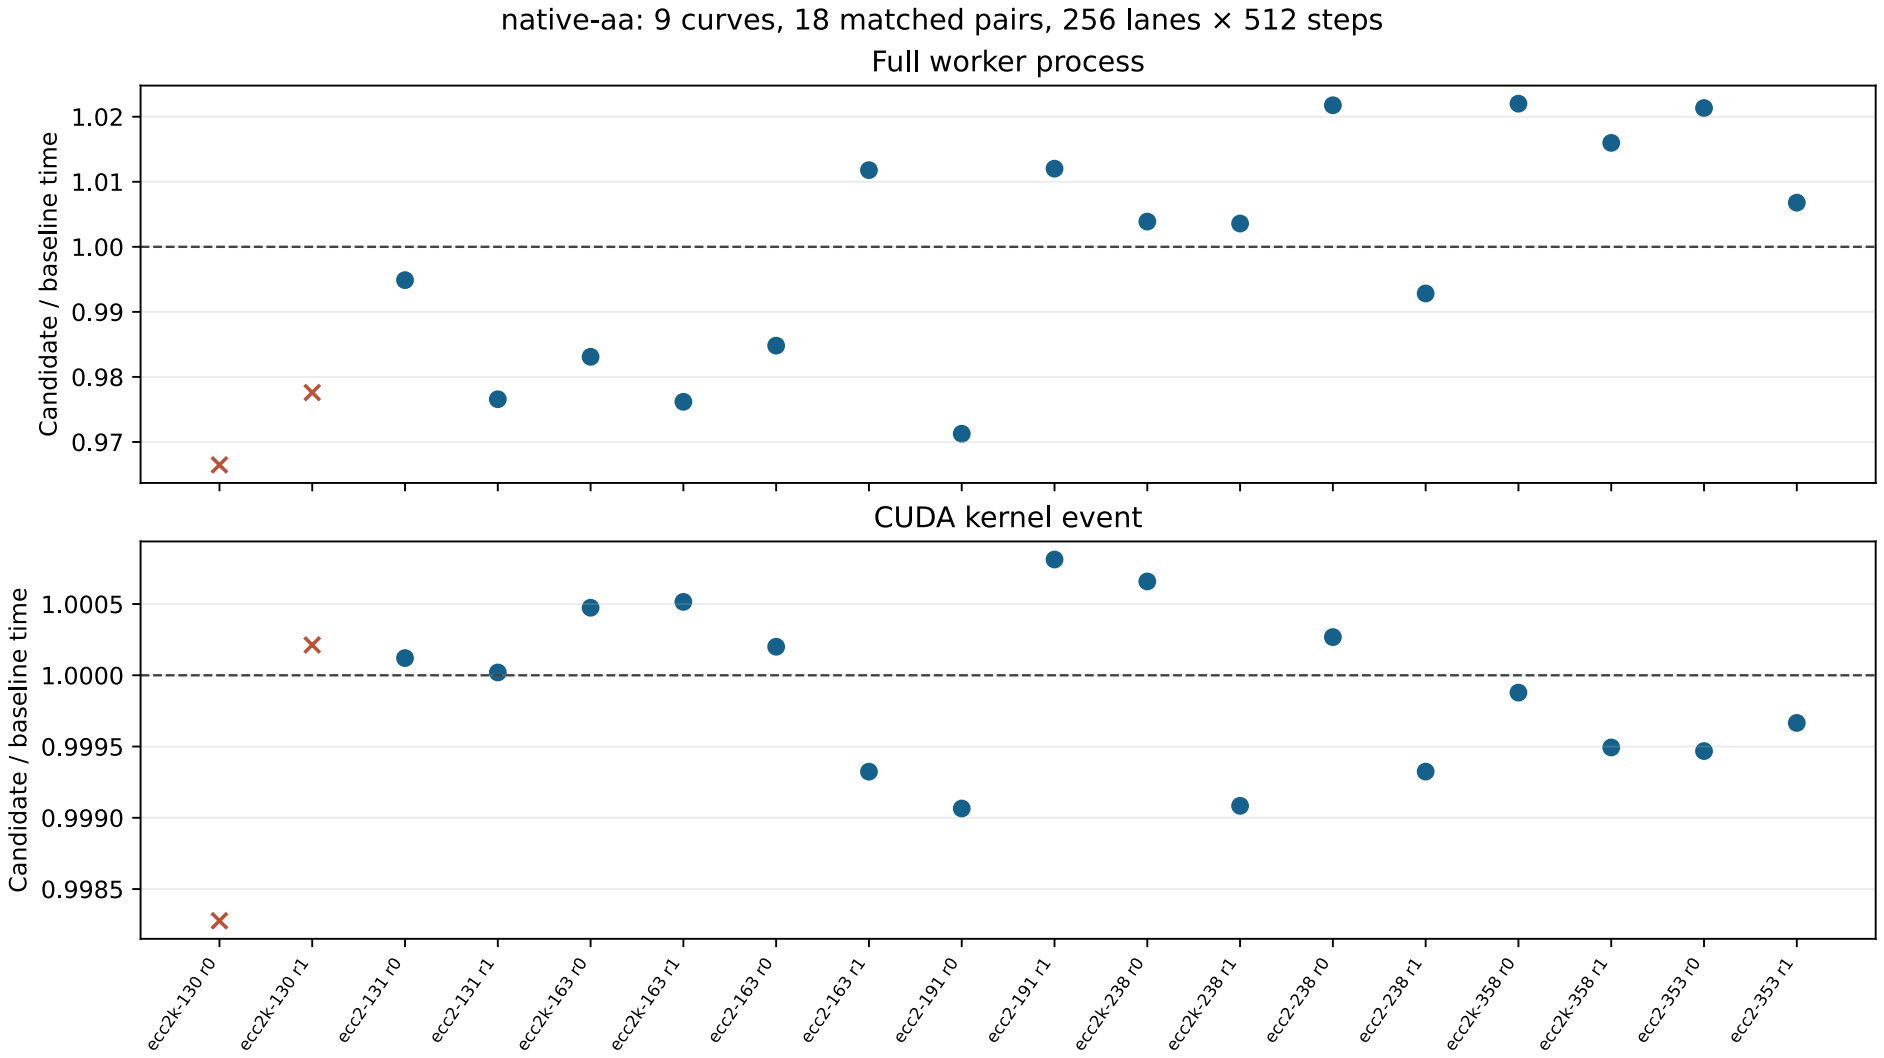
Binary rho L4 measurement: native-aa

Observation record. Receipt: `native-aa/receipt.json`; raw archive: `native-aa/raw.tar.gz`. This document derives values only from the frozen receipt and records no scientific status change.



Circle: baseline bracket drift at most 1.05; cross: larger drift. Dashed line: equal time. Full-process median across stable pairs: 1.004 (n=16). Kernel median across all pairs: 1.000 (n=18). All ratios divide candidate time by the median of its two adjacent baseline times. Workload and controls: nine pinned ECCJOB03 curves, 256 lanes, 512 steps, two repeats. The receipt and raw archive contain exact output, distinguished-point and step checks. Full campaign costs are outside this measured boundary.
